Sharing files with friends and family is a breeze with TeamViewer. Drag-and-drop any file, along. lg infineon sgold3 tool v.2.3.0.1 Q: How to dynamically compile java source file in Clojure How to dynamically compile java source file in Clojure? I want to write a program in Clojure, and compile the program to bytecode. Is there any good Clojure library for doing this? A:

Update: see Amilcar's comment for the way Clojure's clojure.java.io has changed since this was written (that is, no longer available via the :source-paths namespace). It is still possible to do this, but you will need to include all classes you are using dynamically and get at them via clojure.core's get-in function. I would suggest two ways: Get your source code into a form that you can eval, perhaps using lein-compiler. Then use the methods in clojure.compiler to compile it. Get your source code into a form that you can eval, perhaps using clojure.walk. Then use the methods in clojure.compiler to compile it. Evaluating the

source code into a function or form for later processing is much better than compiling it directly to byte code because this allows you to experiment with it, and use tools such as Clojure's debugger or macro compiler (as Amilcar suggests). A: You may want to look at using the antlr/antlr4/codox/clojure.compiler libraries. I believe they are all built on the notion of abstract syntax trees which are a (conceptually) common building block for both lexers and parsers. When you parse a Java source file, the compiled AST is still a Java object (using clojure.java.io) which you can then manipulate (perhaps in a REPL, for example).

From there you can eval the Java code (using clojure.core) and use any of Clojure's functions to manipulate the AST. For example, to parse and evaluate a java file you could do the following: (ns com.foo.bar.antlr-demo) (require '[antlr4.runtime :as antlr]) (require '[clojure.compiler :as comp]) (require '[clojure.java.io :
