Effects of erythromycin on adenosine-3',5'-monophosphate generation by T cells: a comparison with thymidine incorporation. The effect of erythromycin on the generation of the second messenger, adenosine 3',5'-monophosphate (cAMP) in a concanavalin A-stimulated T cell system was studied and compared with its effect on 3H-thymidine uptake. Erythromycin suppressed both processes, although the cAMP generation was more sensitive to the antibiotic than thymidine incorporation. The effects of addition of ATP or adenosine, the proposed cellular precursors of cAMP, to the cell system were investigated. ATP, but not adenosine, enhanced the cAMP accumulation.
