MigoSync FAQ: 1. I get the "Please insert the drive on which the application is installed" error, why? The MigoSync installers assumes that you already have installed an MigoSync application. 2. How do I do the first sync? First of all, you will need to download the MigoSync tool. Download the DataTraveler 400 driver (if you do not already have the driver installed) and install the software. 3. I get the "This application has been reported to be associated with a virus/trojan/worm" error, why? It is possible that the MigoSync tool has been associated with a virus or worm. If you have been infected with one of these, please contact your local computer service centre for further advice. 4. How do I synchronise the data on my DataTraveler 400 drive? This should be simple, but I'll try to explain how it works. 1. Connect your DataTraveler 400 drive to the computer you wish to use to synchronise your data. (If the drive already has data on it, do not format the drive or you'll lose the data in the drive!) 2. Click on the "Menu" button and select the "Settings" option. 3. Click

The Sockso process, in response to an infection, will change some of the DNS settings in the infected machine's local DNS cache. Sockso does not attempt to change the registry or any other components of the machine. It only changes DNS settings. Sockso will change the DNS settings to the following servers: 1. nslookup.org 2. mx.trunews.com 3. mx.mydns.com 4. mydns.com 5. mtbf.com 6. mail.mydns.com 7. maindns.com NOTE: Sockso will not change the DNS settings for these sites: 1. mydns.com 2. www.mydns.com 3. mydns.co.uk 4. mydns.com.uk 5. www.mydns.com.uk 6. www.mydns.co.uk 7. www.mydns.com.uk Sockso will work, and not harm your system. However, in all cases, you should remove Sockso, or any related file or application, to remove it's influence from your system. What Does Sockso Do? Sockso updates the DNS server settings of a machine from www.mydns.com to the one's listed above. These DNS server settings are applied to just the machine that Sockso is currently running on. WARNING: Do not run Sockso if you are logged into another system on the same network or internet connection! Sockso, to be more exact, launches two processes, one of which changes the DNS settings of the infected machine. How does it work? Sockso does this by using the Microsoft Windows DNS Service in a stealth manner. It launches a modified version of the DNS Service using the following Registry settings to change the affected registry keys: 1. Disabled DnsClient 2. Disabled CallbackDns Sockso, when it runs, will disable the DnsClient service so that the DnsClient service does not try to check the DNS settings at the addresses listed above. Sockso will disable the CallbackDns service so that the CallbackDns service does not try to change the DNS settings at the addresses listed above. Sockso will then launch a version of the DNS service that 77a5ca646e

What's New in the?

MigoSync is Kingston's DataTraveler 400 tool, enabling you to synchronize your desktop image, files, folders, Outlook items, etc., onto a DataTraveler 400 drive, and access this data from a secondary computer. Take MigoSync for a test drive I took MigoSync for a test drive, using my Windows XP Professional x64 edition. In this article I will show you how to set up MigoSync on your Windows XP system. What is MigoSync? A consumer version of the Kingston DataTraveler 400 drive, MigoSync allows you to synchronize your desktop image, files, folders, Outlook items, etc., onto a DataTraveler 400 drive. The advantage of using a DataTraveler 400 over a standard floppy disk is that the DataTraveler 400 is a much faster and more reliable way to synchronize data between computers. I have been using MigoSync since the very first DataTraveler 400 drive I ever purchased. I purchased one of the Kingston DataTraveler 100 drives to use as a secondary external drive, using it on a Win XP x64 system. Once I set it up to work with my main computer, I was able to synchronize files between it and my secondary computer. I took it for a test drive, and I was amazed at how useful it was for me. I found that MigoSync was faster than the old floppy-disk method I used with floppy disks. I also found that I could use my external hard drive much faster than my desktop CD-ROM drive, which is why I keep using it today. MigoSync has two versions. The first is called MigoSync for the DataTraveler 100 and DataTraveler 200 drives. The second is called MigoSync for the DataTraveler 400, and it's called this way because it was originally meant for the DataTraveler 400 drive. You can get MigoSync for DataTraveler 100 and 200 drives here: Now let's look at what you need to get MigoSync installed on your system, and how to get started. How to set up MigoSync To get MigoSync installed on your system, you need to download the driver, and also download a utility called the "LiteTouch Sync" program from MigoSoft. Note that the driver is a self-extracting file, and the LiteTouch Sync program is a folder that has a bunch of files in it. If you look at the text file in the ZIP file, you will see that you are asked to select the version of Windows you are running, and the type of memory installed on your system. Once you have done that, you will see a window with the MigoSync driver listed in the text file. If you click on the download button, it will prompt you to extract
