

A needle gauge, or point-of-needle gauge, is a visual display of the distance of a point (point of needle) from a datum line. The datum line can either be in the form of a line on a three-dimensional surface (usually a cylindrical or spherical surface) or as a line drawn on a flat surface, but it is most commonly used as a line drawn along the radius of a cylindrical barrel; the point of needle is then drawn through the barrel. The distance is usually measured from a fixed point: in the case of a barrel of known diameter, the point of needle is usually set at a fixed distance along the radius of the cylinder; or sometimes near a fixed point on the object in question. In that way, the point of needle is at a fixed distance above or below an arbitrary reference position (the zero-point). The numerical value represented by the point of needle is then displayed relative to the zero-point, usually as a percentage (or fraction) of the full range of the needle, but sometimes in terms of the area the point of needle covers in the barrel. Background Historically, the use of a point-of-needle has been part of various fields such as medical and agricultural fields. With the advent of electronics and computer science, various forms of point-of-needle gauges became possible. The implementation of point-of-needle gauges has been used in various three-dimensional graphics applications, in particular for industrial displays and virtual reality. The primary advantage of a point-of-needle gauge is the clear visual representation of the distance of a point (the point of needle) from a datum line (line of zero level). It does not require an additional scale, it is by construction equal to the measure of the distance from datum line. The definition or reference point for which the distance is measured can be set arbitrarily within the gauge or in the object. An array of needles can be placed in the gauge to represent some kind of a multi-dimensional datum line. In a numerical display, the number of needles is usually equal to the dimension of the distance (the number of places in the gauge). A needle gauge can be thought of as a generalization of a "visual bar chart" (representing a mathematical vector), an example of which is the inexpensive "ClueTrak" with which home-decorators used to decorate a room are often confronted

Teroid Needle Gauge is a simple to use, yet powerful program that may be used for measurements, as well as gauging, i.e. designing and finishing. The program provides a quick and convenient gauge for analysing small or large measurements using a single window. It works well with various mathematical functions, and can be used to quickly verify the results of a calculation. The program is suitable for use with a variety of graph and chart types to show the speed and the current magnitude of a measurement over time. The program allows the creation of a gauge with a bar chart, a gauge chart, a line chart, a pie chart and a range. The program can be used to make a gauge as part of a gauge area which can be used with other programs in the Teroid Gauge Suite. Teroid Gauge was designed to suit all users of functional gauge software and will work perfectly with the Teroid Gauge Suite. An optional library of coloured zones, text columns and numerical indexes is provided, making it easier to read the gauge and process the data in it. The gauge has a variable position in the window, which can be altered by drag and drop. The program has several modes of operation, allowing the use of a mouse, keyboard, or a combination of both. This enables the control to be used anywhere on the computer monitor. The program supports a range of operating system and monitor types, including standard, wide, and high resolution monitors as well as Virtual PC monitors. The program provides a logical flow of operation for performing a wide range of measurements, such as measuring an area, the distance between a few points, the size of an area, the size of a room, the height of an object, and the depth of a hole. The program can be used to measure an exact area with no size, for estimating the dimensions of an area, to define a boundary for a measurement, or for measuring the size of an area. The program provides a list of measurement functions that can be used in various modes to produce the results you want. The functions can be grouped to make it easier to choose the required functionality. The functions included in the measurement section enable the performance of quick approximate measurements as well as measurements of the exact size, quantity and area. The program can also be used to draw simple geometric shapes. The program can be used to produce a progress gauge for measuring length, area, volume, and perimeter. The new Teroid Needle Gauge is a major upgrade with many new features and additional useful functions. The improvements to the Teroid gauge control include:

- New Radial Gauge Layout
- Color and Text Transparence with Tone
- New Aligned & Centered Gauge with Points, Labels, and Percentages
- Width Adjustment
- Precision
- Works with Native Windows or WinForms with the.NET Framework 3.0
- Works with XNA (C#)
- Minor Bug Fixes

Teroid Needle Gauge demonstrates the versatility of the control by displaying numerical data in a radial gauge style with a color background and transparent text. In addition, a numeric index is created as a background to the gauge, along with the appropriate amount of space for labels with numerically appropriate labels. The labels can also be formatted to fit within the gauge with font, color, and text opacity. The Teroid gauge control is designed to serve as a replacement for the default Windows gauge, and continues to add features to retain it's status as the control of choice. The visual appearance of the Teroid gauge is very customizable to suit the user's needs. The appearance of the gauge can be customized in a number of ways including:

- Text Transparence
- Border (Background) Color
- Text Color
- Throbbing Bars (Active Zones)
- Background Color
- Border (Background) Opacity
- Bar (Background) Opacity
- Centering
- Vertical or Horizontal Alignment
- Gauge Rotation, Vertical or Horizontal
- Bar Rendering
- Radius
- Tick Slope
- Gauge Shape
- Background Image
- Fill Image

The control also provides support for all aspects of the Radial Gauge, including:

- Absolute Value
- Absolute Scale
- Absolute Zones
- Relative Value
- Relative Scale
- Relative Zones
- Absolute percent
- Relative percent
- Percent of Full Range
- Absolute Scale X
- Absolute Scale Y
- Relative Scale X
- Relative Scale Y
- Relative Zones X
- Relative Zones Y
- Scale X
- Scale Y
- Text Transparence

So, my script is basically setting variables \$x and \$y. \$x is the input, \$y is the output. #!/bin/bash #Setting variables here #if there is one input var1=read -p "Enter x: " #if there is two inputs var1=read -p "Enter x: " var2=read -p "Enter y: " #if there is one output print "\${var1} + \${var2}" #if there are two outputs print "\${var1} + \${var2}" #if there are three outputs print "\${var1} + \${var2}" #Checking conditions if [ \$var1 -eq 1 ] #if there is one input then eval "echo \$var1 + \$var2" elif [ \$var1 -eq 2 ] #if there is two inputs then eval "echo \$var1 + \$var2" elif [ \$var1 -eq 3 ] #if there are three inputs then eval "echo \$var1 + \$var2" else eval "echo not one or two or three" fi In this case \$var1 has one input, \$var2 has two inputs. I want the output to be: var1 + var2 var1 + var2 var1 + var2 Can anyone tell me why the -eq 3 does not work? I have tried to add a \$var1 = '1' \$var2 = '2' to see if it needs to be '1' or '2',
