The db files have the extension of sqlite. If you want to use all the features of SQLite, you can create the file for yourself by doing the following: Open the command line and type "sqlite3 my_database.sqlite" Enter your database name and press enter Enter "exit" to close the database Open up a separate Delphi window and create a new TSQLiteDatabase object, using the same name as your database, for example "my_database.sqlite" Connect to that database with the TSQLiteDatabase.Connection property, specifying the

DISQLite3 is a safe and efficient alternative to the ODBC and InterBase access methods, which are still preferred by some developers. This lightweight version is designed to provide a fast, lightweight SQL database engine with a flexible environment that can easily be integrated into any Delphi application. In addition to the SQLite3 database engine, DISQLite3 also includes a complete SQLITE3 API that allows you to make use of the many SQLite3 features. And it includes a RAD toolkit with many components. DISQLite3 Personal Edition Serial Key Features: Support for Delphi and C++ Builder environments. Multiple language support. This package contains the code and data for a tool to add to the Delphi IDE to help with database support. ServerBase is a Class Library (DLL) to facilitate the creation of an Embedded Web Server with php, as well as a set of Delphi Components to facilitate an efficient development process with web services and a persistent database that communicates with multiple components at the same time. The system is composed by three parts: For more information, please read the document -The Web Service for Delphi Components, XML DSQLite3 (instead of TDataSet) The XML Server doesn't use a database, just a parser for the queries and result sets. So, it is not compatible with any query for your data. But you could use this server with other server components that use the database. The XML server is really an implementation of how to retrieve data in the most efficient way using XML documents. It uses the W3C's XSD schema and the.NET XmlDocument class to do the job. This implementation can only work when XSD is available. In the future, we will try to implement a more efficient way to retrieve the data. XML How does the XML server work? 1 The XML Server sends the XML request to the XSD schema defined in XML server class (XMLSERVER.pas) to produce an XML document from the request. 2 The XML Server reads the XML document and convert the XML document to an internal data structure that can be read and write by the Delphi components. 3 The components that use the data structure as a record can read and write their data. 4 The XML server component also send the XML response to the XML server (XMLSERVER.pas). 5 The components that use the XML document as data can read and write the XML document. 6 The components that use the data structure as a record can read and write their data. How does the XML server component work? 1 The XML Server component reads the request from the component's QT and sends the XML document as a response to the component. 2 The components that use the XML document as data can read and write their data. How does the XML server component work? 1 The XML Server component reads the

DISQLite3 is a library that provides a self-contained, embeddable, zero-configuration SQL database engine. The library can be used in your applications, either stand-alone or within the RAD Studio framework. This library is different from standard SQLite3 library. This one is self-contained, meaning that it has its own version of SQLite3 library. It is embeddable, meaning that your application is running within the database engine. It is zero-configuration, meaning that you do not need to install the sqlite3.dll in your application's directory structure. Features: 1. Uses SQLite3 as the embedded database engine, supporting the SQLite3 API and the SQLite3 command line tools. 2. Embedded Database engine, so no need to install sqlite3.dll into your project. 3. Suitable for Delphi and C++Builder. 4. Encapsulates the SQLite3 engine into a simple and intuitive API. 5. Supports both the stored procedures and the embedded SQLite3 APIs. 6. Provides a fully functional RAD Studio Firemonkey database engine with the FireDAC components. Use cases: It can be used as: 1. A database engine for database application; 2. A Database engine for FMX FireDAC components; 3. A stand-alone or embedded database engine for your application. Notes: You can refer to for more information about SQLite3.
