Nuc-End-Remover is a simple and easy to use program that aims to help users who need to modify nucleotide sequence data on the fly. The program is able to scan a loaded FAST or tab delimited sequence file

### **What's New in the?**

nuc-end-remover is an easy to use software designed to help you modify sequence files. As a basic application, it doesn't add any new functionality, but it is definitely very easy to use and it can be useful for deleting nucleotides from sequence files. It will remove the specific sequence from the file without modifying it. The Nuc-End-Remover simply edits a file by deleting the sequence that you ask it to. You can use the application as follows: - Select the files you want to edit from a folder (either from the current folder or from a network share). - Open the selected files. - Write the Nuc-End-Remover application name in the console, run the application and select the file that needs to be deleted. Nuc-End-Remover will then start the operation, and will create a temporary file (with the Nuc-End-Remover extension) in the current folder or on the network share. The temporary file will be deleted at the end of the operation. While nuc-end-remover is running, the Console will show you the progress of the file editing. When you have finished, the program will ask you if you want to show the list of deleted file, or to delete the temporary file as well. Sometimes the nucleotides that you want to remove are at the beginning or at the end of the sequences, for example in cases where you have the contig assembled, but you want to keep the nucleotides you have found at the end of the contig and have removed the last contig. The Nuc-End-Remover application allows you to remove these nucleotides from sequences, and save the results to a new FASTA file, or a tab-delimited file. In both cases, the edited file is saved back to the original sequence directory or network share. In this way, you can remove the last contig sequences, as well as the sequences at the beginning of the file, etc... As the application is able to edit the target sequences, the user must first verify that the FASTA file has a header row that contains the number of sequences. Nuc-End-Remover Software Screenshots: Nuc-End-Remover Software Sub-Screenshots: Nuc-End-Remover Installation: After downloading nuc-end-remover.zip, unzip it in any folder, and run the Nuc-End-Remover.exe program. Nuc-End-Remover will open the application and will start the operation. You will be asked to choose the target sequence file from your local file system or from a network share. You can also select multiple sequence files. After choosing your file, Nuc-End

---

## System Requirements For Nuc-End-Remover:

128-bit CPU, 32-bit or 64-bit Minimum RAM: 512 MB Video Card: 128 MB DirectX 9 video card DirectX 9 For Windows XP For Windows Vista How to play this game: 1. Download and install the game. 2. If you have a graphics card compatible with the requirements, it is recommended to download and install a graphics driver (we recommend the "NVIDIA® GeForce® GT 120" driver). 3. Download and install the Microsoft Visual C++ 2010 Redist
